Dear Patients of Lomibao Rheumatology & Wellness Care:

The ongoing COVID-19 pandemic is an ever evolving situation and many patients have the same questions. As such we have compiled a list of frequently asked topics, based on the most current data.

Lomibao Rheumatology & Wellness Care (“the practice”) supports the recommendations of the American College of Rheumatology (ACR) and the Centers for Disease Control (CDC):

- The practice supports that ALL individuals who qualify for and can safely receive COVID vaccination receive it - as the benefits far outweigh the risks
- The practice supports that there is NO consistent evidence that COVID vaccination causes or flares up rheumatology disease - and that the benefits still far outweigh the hypothetical risks
- The practice supports that Rheumatology patients are recommended to receive the 3rd dose COVID vaccination booster, especially those who use high-risk medications
- The practice supports that per the ACR: “Healthcare providers should not routinely order any lab testing (e.g., antibody tests for IgM and/or IgG to spike or nucleocapsid proteins) to assess immunity to COVID-19 post-vaccination, nor to assess the need for vaccination in a yet-unvaccinated person.”
- Due to the above, the practice will respectfully decline requests to order laboratory tests as described and will refer patients back to their PCP

Patient safety is our utmost priority and we thank you for your continued support in protecting our Rheumatology patients by getting vaccinated, wearing a mask when you visit our facility, and other precautions as indicated.

In Good Health,
Lomibao Rheumatology & Wellness Care, PLLC
